

## **ABSTRACT OF THE DISCLOSURE**

An automatic hitch may include a base, a support surface, a jaw assembly connected to the base and having engaged and disengaged positions and a biasing member associated with the jaw assembly. The biasing member may be configured to

5 normally bias the jaw assembly toward the support surface. The automatic hitch may also include a release mechanism configured to apply upward force to the jaw assembly upon downward actuation of the release mechanism to move the jaw assembly into the disengaged position.
